

Justified Layout and Subset Fonts in Traffic Papers

H. Typesetter, I. Compositor

Abstract

Publisher PDFs encode inter word gaps as positioning and ship subset fonts with no character map, so a parser that trusts the extractor loses spaces and reads headings as nonsense. This fixture carries one instance of each fault.

1 Introduction

The major limitation of existing solutions is that they highly rely on the deep features, which are overly dependent on data size and hard to generalize on unseen data collected at a second capture site.

The paragraph above contains no space glyph at all: every gap in it is a pen movement, and only the geometry says where one word ends.

2 Method

We record the offset each font displaces its codes by, validate it on that font's own words, and apply it only to the spans of that font.

Recovery is reported rather than assumed, so a reviewer can see which blocks the parser could not read before quoting any of them.
